

The Location:

Development site, Leicester

The Requirement:

A major player in the property development sector decided to look for an alternative solution for creating a temporary site parking area. Previously they had always used tarmac – a solution they had come to realise was expensive, inflexible and time-consuming. They needed a surface that would last the duration of their project; at least four years. And even more importantly they wanted a solution that was inexpensive, strong, reusable and easy to lay.

The Solution:

After consulting with the Ground-Guards team, we advised that Fast Cover tiles would be the best fit for their needs, as these guarantee a strong, durable and anti-slip surface and all at an economical price.

The Outcome:

In next to no time, the client had a great-looking, functional car park on one of their large sites, built over a base of crushed stone. The site is designed to be durable and to last for the length of the project, four years, and beyond. At the end of the project, the tiles are easily removable and available to reuse on their next building project, providing a great return on investment.
