

### The Location:

New housing development site.

### The Requirement:

A clean, safe, temporary walkway was required around the site cabins and across the site to reduce the amount of mud being trodden into the cabins and the new dwellings. The solution needed to be easy to lay, lift and move throughout the duration of the project, and suitable for workers carrying tools and materials.

### The Solution:

The Ground-Guards team recommended FastCover, having been used previously in this situation many times.

The 1.2m x 0.8m recycled PVC mats only weigh 20kg each and interlock together to form a strong, safe walkway that can easily be moved around the site and reused on many sites in the future. The mats have a high traction finish making them a great choice for construction sites.

### The Outcome:

With the FastCover installed, mud from foot traffic was immediately reduced making cabins and new dwellings much cleaner.

The FastCover mats made a defined walkway across the site so muddy routes didn't have to be found.

The client was highly delighted and commented:

*'The site team are very impressed with how these mats perform over uneven ground to create a safe and pleasant walkway'*
