

The Location:

Housing development site,
Market Harborough

The Requirement:

A major national house builder had major vehicle access issues and needed temporary access for construction vehicles on site for 14 weeks:

- Early stage construction
- Sloping ground
- Excess water

The Solution:

MaxiTrack: A high strength, lightweight, heavy-duty, re-useable trackway system.

Weighing only 40kg each, MaxiTrack mats are lightweight and easy to off-load by hand. The mats are simple to bolt together to quickly create the desired roadway with minimal preparation required to the ground.

The Outcome:

With its SmartGrip™ tread providing superior traction for all the vehicles on site, a neat, high functioning temporary roadway was quickly constructed over the muddy ground in next to no time.

This vastly improved the safety and efficiency of the site, an outcome that the company's senior engineers were delighted with.

MaxiTrack is being increasingly deployed across housebuilding projects.
